1 Descriptive statistics for parametric models currently rely heavily
2 on the accuracy of distributional assumptions. Here, leveraging the
3 structures of parametric distributions and their central moment kernel
4 distributions, a class of estimators, consistent simultaneously for both
5 a semiparametric distribution and a distinct parametric distribution,
6 is proposed. These estimators are robust to both gross errors and
7 deviations from parametric assumptions, demonstrating excellent per-
8 formance when estimating the mean and central moments of common
9 unimodal distributions.
