1 Descriptive statistics for parametric models currently rely heavily  
2 on the accuracy of distributional assumptions. Here, leveraging the  
3 structures of parametric distributions and their central moment ker-  
4 nel distributions, a class of estimators, consistent simultaneously for  
5 both a semiparametric distribution and a distinct parametric distribu-  
6 tion, is proposed. These estimators are robust to both gross errors  
7 and departures from parametric assumptions, demonstrating excel-  
8 lent performance when estimating the mean and central moments of  
9 common unimodal distributions.
