1 Descriptive statistics for parametric models currently rely heavily
2 on the accuracy of distributional assumptions. Here, leveraging the
3 structures of parametric distributions and their central moment ker-
4 nel distributions, a class of estimators, consistent simultaneously for
5 both a semiparametric distribution and a distinct parametric distri-
6 bution, is proposed for estimating the mean and central moments.
7 These estimators are robust to both gross errors and departures
8 from parametric assumptions, demonstrating excellent performance
9 in common unimodal distributions. This article also illuminates the
10 understanding of the common nature of probability distributions and
11 the measures of them.
